

DVWA

Created an Damn vulnerable web application to test the scanners(cryptographic failures and insecure design)

I first isolated the container from LAN , i will probably isolate every container as default unless and until i specifically require it to be on LAN.

Here's the output of cryptographic failure scanner report, it works as intended.

```
A04 Cryptographic Failures Scan – 10.10.10.2
=====
FINDING                                SEVERITY  METHOD  LOCATION
-----
Plaintext HTTP Accepted / No HT  HIGH      GET    http://10.10.10.2/
-----
Summary: 1 finding(s) (1 HIGH)
Duration: 0.02s
```

It only tested the login page of DVWA.

Now testing insecure design module

```
A06 Insecure Design Scan – http://10.10.10.2/vulnerabilities/brute/
=====
FINDING                                SEVERITY  METHOD  LOCATION
-----
Missing Rate Limiting              MEDIUM    GET    http://10.10.10.2/vulnerabilities/brute/
-----
Summary: 1 finding(s)
Duration: 0.05s
```

The module was working perfectly.
